GCSE Higher Mathematics Practice Test 7: Probability

Instructions:

Answer all questions. Show your working clearly. Calculators may be used unless stated otherwise.

Time allowed: 90 minutes

Section A: Conditional Probability Fundamentals

- 1. A survey of 260 students shows:
 - 155 study German
 - 128 study Italian
 - 78 study both German and Italian
 - (a) Draw a Venn diagram
 - (b) Find P(studies German studies Italian)
 - (c) Find P(studies Italian studies German)
 - (d) Find P(studies exactly one subject)
 - (e) Are studying German and Italian independent? Justify your answer
- 2. A box contains 12 coral balls and 18 navy balls. Two balls are drawn without replacement.
 - (a) Find P(second ball is coral first ball is coral)
 - (b) Find P(second ball is navy first ball is coral)
 - (c) Find P(both balls are the same color)
 - (d) Find P(balls are different colors)
 - (e) Verify that your probabilities sum to 1
- 3. Events N and P are such that:
 - P(N) = 0.62
 - P(P) = 0.39
 - P(N P) = 0.28

Calculate:

- (a) P(N P)
- (b) P(N')
- (c) P(N P)
- (d) P(P N)

- (e) P(N' P')
- (f) P(N P')
- 4. A card is drawn from a standard 52-card deck. Let N = "card is an even number" (2, 4, 6, 8, 10) and P = "card is a Jack".
 - (a) Find P(N), P(P), and P(N P)
 - (b) Calculate P(N P)
 - (c) Calculate P(P N)
 - (d) Are events N and P independent? Show your working
 - (e) Find P(N' P')

Section B: Tree Diagrams and Sequential Events

- 5. A bag contains 12 amber counters and 9 jade counters. A counter is drawn, its color noted, and then replaced. This process is repeated twice more.
 - (a) Draw a tree diagram for all three draws
 - (b) Find P(all three counters are amber)
 - (c) Find P(exactly two counters are jade)
 - (d) Find P(at least one counter is amber)
 - (e) Find P(first counter is jade exactly two are jade)
- 6. Box V contains 8 red balls and 2 white balls. Box W contains 4 red balls and 8 white balls. A fair coin is flipped to choose a box, then a ball is drawn.
 - (a) Draw a tree diagram
 - (b) Find P(red ball)
 - (c) Find P(white ball)
 - (d) Given a red ball was drawn, find P(it came from Box V)
 - (e) Given a white ball was drawn, find P(it came from Box W)
- 7. Three machines produce components with different defect rates:
 - Machine C: produces 58% of components, 6% defective
 - Machine D: produces 26% of components, 11% defective
 - Machine E: produces 16% of components, 17% defective
 - (a) Find the overall probability of a defective component
 - (b) If a component is defective, find the probability it came from Machine C
 - (c) If a component is defective, find the probability it came from Machine E
 - (d) If a component is not defective, which machine most likely produced it?
- 8. A student takes three tests. The probability of passing each test is 0.81, and the tests are independent.
 - (a) Find P(passes all three tests)
 - (b) Find P(fails all three tests)
 - (c) Find P(passes exactly two tests)
 - (d) Find P(passes at least one test)
 - (e) Given the student passed at least two tests, find P(passed all three)

Section C: Bayes' Theorem Applications

- 9. A medical test for a disease has the following characteristics:
 - If a person has the disease, the test is positive 82% of the time
 - If a person doesn't have the disease, the test is negative 91% of the time
 - 2.5% of the population has the disease
 - (a) Find P(positive test)
 - (b) If someone tests positive, find P(they have the disease)
 - (c) If someone tests negative, find P(they don't have the disease)
 - (d) Comment on the reliability of a positive test result
 - (e) How would the results change if 25% of the population had the disease?
- 10. A security system has three sensors. The probability each sensor detects an intruder is:
 - Sensor C: 0.93
 - Sensor D: 0.89
 - Sensor E: 0.97

The sensors operate independently.

- (a) Find P(all three sensors detect an intruder)
- (b) Find P(at least one sensor detects an intruder)
- (c) Find P(exactly two sensors detect an intruder)
- (d) If exactly two sensors detect an intruder, find P(Sensor D failed)
- (e) Which single sensor is most reliable for detection?
- 11. A factory produces items using two processes. Process V is used 71% of the time and produces 9% defective items. Process W is used 29% of the time and produces 18% defective items.
 - (a) A random item is selected and found to be defective. Use Bayes' theorem to find P(produced by Process V)
 - (b) If 1000 items are produced, how many would you expect to be defective?
 - (c) How many of the defective items would come from each process?
 - (d) To reduce overall defect rate to 8%, what should Process W's defect rate be?
- 12. Three weather forecasting models predict rain independently:
 - Model C: 87% accurate when it will rain, 89% accurate when it won't rain
 - Model D: 74% accurate when it will rain, 95% accurate when it won't rain
 - Model E: 92% accurate when it will rain, 83% accurate when it won't rain

Historically, it rains 37% of days.

- (a) If all three models predict rain, find P(it actually rains)
- (b) If Model C predicts rain but Models D and E predict no rain, find P(it rains)
- (c) Which model would you trust most for a "rain" prediction?
- (d) Which model would you trust most for a "no rain" prediction?

Section D: Introduction to Binomial Distribution

- 13. A fair coin is flipped 20 times.
 - (a) Find P(exactly 11 heads)
 - (b) Find P(at most 8 heads)
 - (c) Find P(at least 13 heads)
 - (d) Find the expected number of heads
 - (e) Find the most likely number of heads
 - (f) Calculate the variance of the number of heads
- 14. A multiple choice test has 26 questions, each with 4 possible answers. A student guesses randomly on all questions.
 - (a) State the distribution of the number of correct answers
 - (b) Find P(exactly 9 correct answers)
 - (c) Find P(more than 11 correct answers)
 - (d) Find the expected number of correct answers
 - (e) Find P(passes the test) if the pass mark is 35%
 - (f) Calculate the standard deviation of correct answers
- 15. The probability that a seed germinates is 0.71. A packet contains 24 seeds.
 - (a) Find P(all seeds germinate)
 - (b) Find P(exactly 18 seeds germinate)
 - (c) Find P(fewer than 14 seeds germinate)
 - (d) How many seeds would you expect to germinate?
 - (e) Find P(at least 70% of seeds germinate)
 - (f) What's the most likely number of seeds to germinate?
- 16. A manufacturing process produces 13% defective items. Quality control samples 30 items.
 - (a) Find P(no defective items in the sample)
 - (b) Find P(exactly 5 defective items)
 - (c) Find P(more than 6 defective items)
 - (d) Calculate the expected number of defective items
 - (e) Find P(defect rate in sample exceeds 20%)
 - (f) Calculate the probability that the sample defect rate is between 8% and 17%

Section E: Advanced Binomial Applications

- 17. A basketball player has a 82% free throw success rate. In a game, they attempt 30 free throws.
 - (a) Model this situation and state any assumptions
 - (b) Find P(makes at least 26 free throws)
 - (c) Find P(makes between 22 and 26 free throws inclusive)
 - (d) Calculate the expected number of successful free throws
 - (e) Find the probability their success rate in this game is above 87%
 - (f) What's the minimum number of attempts needed for P(at least 1 success) 0.99999999?

- 18. A quality control inspector checks 42 items per hour. The probability any item is defective is 0.14.
 - (a) Find P(finds exactly 6 defective items in one hour)
 - (b) Find P(finds no defective items in one hour)
 - (c) Over a 6-hour shift, find the expected number of defective items found
 - (d) In what percentage of hours would you expect to find more than 9 defective items?
 - (e) If the inspector finds 11 defective items in one hour, comment on whether this is unusual
- 19. A pharmaceutical company claims their drug is effective for 89% of patients. A trial involves 34 patients.
 - (a) If the claim is true, find P(drug works for exactly 30 patients)
 - (b) Find P(drug works for at least 28 patients)
 - (c) Calculate the expected number of patients for whom the drug works
 - (d) If the drug works for only 25 patients, test whether this supports the company's claim
 - (e) What's the minimum number of successes that would support the 89% claim at 5% significance?
- 20. A survey shows 54% of people support a proposal. A random sample of 38 people is surveyed.
 - (a) Find P(exactly 20 people support the proposal)
 - (b) Find P(fewer than 17 people support the proposal)
 - (c) Calculate the expected number of supporters
 - (d) Find P(between 45% and 65% of the sample support the proposal)
 - (e) If 26 people in the sample support the proposal, is this significantly different from expected?

Section F: Combined Probability Scenarios

- 21. An online retailer has two suppliers. Supplier V provides 76% of goods with 8% defect rate. Supplier W provides 24% of goods with 19% defect rate.
 - (a) A customer receives 28 items. Find P(exactly 3 are defective)
 - (b) If a customer complains about a defective item, find P(it came from Supplier W)
 - (c) A batch of 300 items arrives. Find the expected number from each supplier
 - (d) Calculate the overall defect rate
 - (e) If the company wants to reduce defects to 7%, what should Supplier W's rate be?
- 22. A casino game involves drawing 9 cards from a standard deck without replacement. The player wins if all 9 cards are clubs.
 - (a) Calculate P(all 9 cards are clubs)
 - (b) Calculate P(all 9 cards are the same suit)
 - (c) If 4000 people play this game, how many would you expect to win?
 - (d) What should be the payout ratio for this to be a fair game?
 - (e) How does the probability change if cards are replaced after each draw?
- 23. A communication system sends signals through 9 independent channels. Each channel has probability 0.86 of successful transmission.
 - (a) Find P(message received successfully through all channels)

- (b) Find P(message fails on exactly one channel)
- (c) The system works if at least 8 channels succeed. Find P(system works)
- (d) If the system sends 150 messages, find P(fewer than 130 are received successfully)
- (e) What should be the individual channel reliability for 99.99% system reliability?
- 24. A hospital emergency department sees an average of 28% critical cases. On a particular shift, 35 patients arrive.
 - (a) Model the number of critical cases and state assumptions
 - (b) Find P(exactly 10 critical cases)
 - (c) Find P(no critical cases)
 - (d) Find P(more than 15 critical cases)
 - (e) Calculate the expected number of critical cases
 - (f) If there are 18 critical cases in one shift, is this unusually high?

Section G: Advanced Problem Solving

- 25. A genetic disorder affects 1 in 550 births. A screening test is 85% accurate for positive cases and 99.5% accurate for negative cases.
 - (a) Calculate the probability of testing positive
 - (b) If a baby tests positive, what's the probability they have the disorder?
 - (c) How many false positives occur per 55,000 births?
 - (d) Design a two-stage testing procedure to reduce false positives
 - (e) Comment on the ethical implications of these probabilities
- 26. A software company releases updates with bugs 34% of the time. They use a testing protocol that catches 71% of buggy updates but also flags 13% of good updates as potentially buggy.
 - (a) If an update is flagged, find P(it actually has bugs)
 - (b) If an update passes testing, find P(it's actually bug-free)
 - (c) In 500 updates, how many false alarms would you expect?
 - (d) Suggest improvements to the testing protocol
 - (e) Calculate the overall accuracy of the testing system
- 27. A lottery has the following structure: pick 8 numbers from 1-32. You win the jackpot if all 8 match.
 - (a) Calculate P(winning the jackpot)
 - (b) Find P(matching exactly 7 numbers)
 - (c) Find P(matching exactly 6 numbers)
 - (d) If 22 million tickets are sold, find P(no one wins the jackpot)
 - (e) Model the number of jackpot winners as a binomial distribution
- 28. A cybersecurity system monitors network traffic. It correctly identifies 85% of malicious attacks and incorrectly flags 8% of normal traffic. On average, 0.7% of traffic is malicious.
 - (a) Find the probability of an alert
 - (b) If there's an alert, find P(it's a real attack)
 - (c) In monitoring 1,200,000 data packets, how many false alarms occur?

- (d) Design a cost-benefit analysis for this system
- (e) How would increasing the detection rate to 89% affect false alarms?
- 29. Design and analyze a probability model for a real-world scenario of your choice:
 - (a) Define the scenario and identify random variables
 - (b) State all assumptions clearly
 - (c) Choose appropriate probability distributions
 - (d) Calculate relevant probabilities
 - (e) Discuss limitations and potential improvements
 - (f) Consider practical applications of your analysis
